Quiz 2 (#5)

Your name: Yuta Nemoto

Your student no.: m523/153

1) In which situations you need to create and apply new migrations?

Every time we install or modify an app, and when we need to change the database schema.

2) What should be done to get convenient textual representations of database objects in the admin console?

We need to provide a custom textual label by providing __str__() function.
For example,   def __str__(self):
                    return self.name

3) How to implement a Many-to-One relationship in Django (suppose one Owner can have several Car objects)?

We use foreign keys to refer a value in another table.
For example, the relation one Owner can have several car objects can be presented as: class Car(models.Model):
                    owner = models.ForeignKey(Owner, on_delete...)
    ```

4) Can you have several Apps inside one Project?

Yes, I can.
